

Sewer cleaning, inspection and relining

Our statewide project cleans, inspects and relines sections of ageing sewer infrastructure, keeping it reliable for years to come.

Why sewer relining instead of replacing?

Sewer relining is a smarter, more efficient way to renew aging pipes. Instead of digging up and replacing old sewer lines, we install a new, durable lining inside the existing pipes, reinforcing them from within. It's a less disruptive and more cost-effective process.

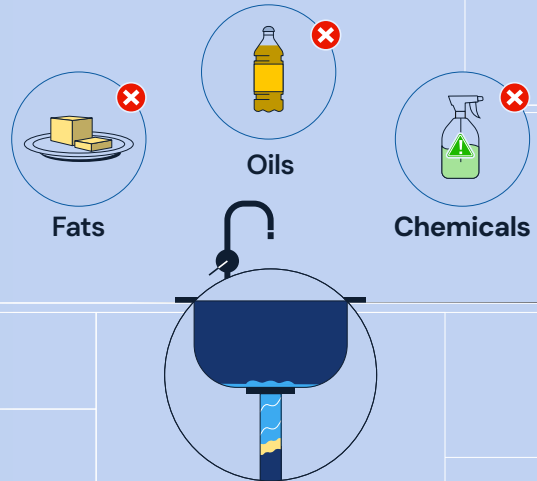

What to expect

- Work crews and vehicles in your area
- Some noise while machinery is operating
- A harmless temporary odour
- Traffic and pedestrian changes to keep everyone safe

Protecting our sewer system starts with you

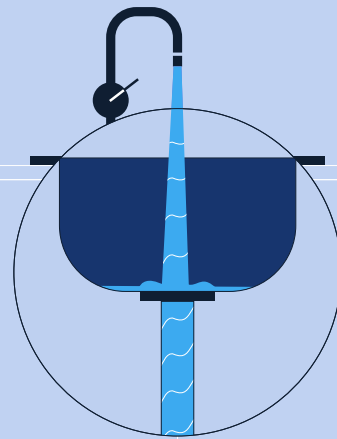

What you can do

What goes down the drain matters! Pouring fats, oils, and chemicals down sinks can clog pipes, damage the sewer system, and make wastewater harder to treat, and ultimately impact Tasmania's environment.

Tip to reducing odours

To help prevent any temporary odours from entering your home, simply pour a small amount of water (equivalent of four litres, or running the tap for 60 seconds) down sinks, drains, and floor waste outlets before and at regular intervals during the work. This helps maintain the water seal in your pipes.
